

The Natural Water Cycle:

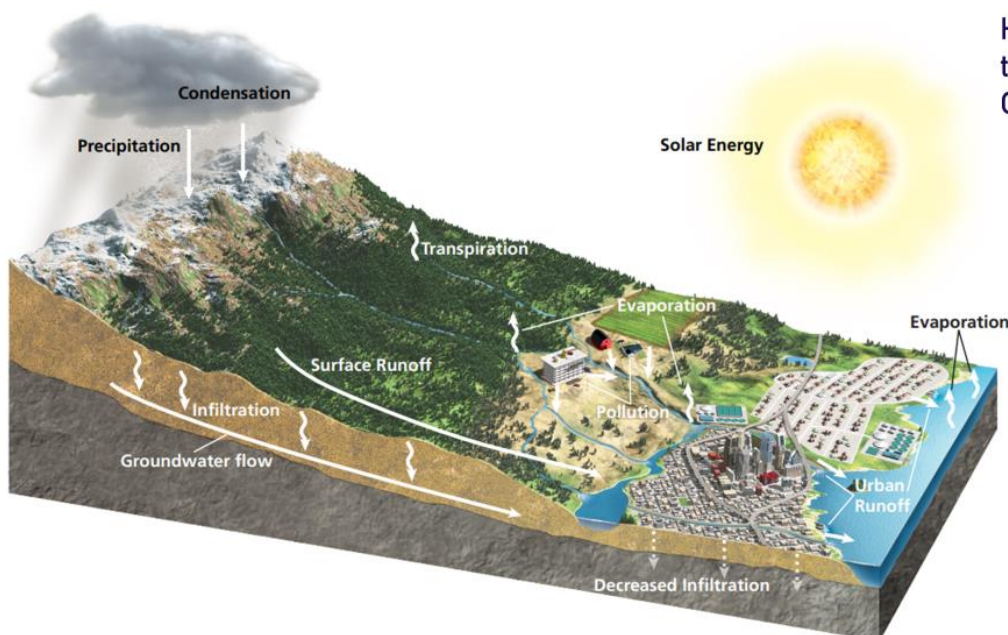

Water is constantly on the move on our planet.

This is the natural state without human intervention.

When human populations were small, fresh water was easily accessible, and rarely polluted.

The Urban Water Cycle:

When we began to build cities we interrupted the water cycle.

How have we changed the Natural Water Cycle?

1. We capture water in reservoirs
2. We direct storm water
3. We create waste water and pollution

We also remove trees and plants for agriculture and industry
